Subject: Application for a Internship in Visual Anomaly Detection for Autonomous Mobile Robots

Dear Sir or Madam,

Currently pursuing a double degree between École Centrale de Lyon and KTH Royal Institute of Technology in Stockholm, I am looking for a six-month Final Degree Internship in Paris, starting in February 2025. My generalist education at Centrale Lyon, focused on applied mathematics, engineering, and the analysis of complex systems, is now complemented by a specialization in computer science and machine learning at KTH. This dual background offers a particularly valuable combination, providing both a broad engineering perspective and in-depth expertise in artificial intelligence methods.

It is within this context that I am submitting my application for an internship at Inria, specifically for the position of Intern in Visual Anomaly Detection for Autonomous Mobile Robots. I am particularly inspired by Inria's leading role in advancing artificial intelligence through fundamental and applied research that bridges scientific innovation and societal impact. Your commitment to open science, interdisciplinary collaboration, and the development of trustworthy, efficient, and interpretable AI systems resonates strongly with my professional goals. The opportunity to contribute to cutting-edge research where AI is not only a technological enabler but also a means to address real-world challenges aligns perfectly with my aspiration.

During my internship at RTE, I had the opportunity to work on a project aimed at integrating artificial intelligence tools into existing technical processes. This experience gave me a practical and nuanced understanding of the challenges involved in bringing AI into industrial settings, not only in terms of the capabilities and limitations of current tools, but also in terms of the organizational and human dimensions that such transformations involve. In parallel, I have gained strong expertise in deep learning, computer vision, and probabilistic modeling through a range of academic and personal projects, particularly in modern architectures such as transformers and CNNs, leveraging Python, PyTorch, and key supporting libraries. I am particularly passionate about AI research, and I regularly follow the field's latest developments through research articles on arXiv, which continually inspire me to explore innovative approaches and remain at the forefront of the discipline.

Curious, rigorous, and highly motivated, I am confident that my profile would allow me to contribute effectively to your team's work. I would be delighted to further discuss this opportunity with you in an interview.

Sincerely,
Clément Corbeau—Izorche
